U.S. Patent and Trademark Office PTOL-303 (Rev. 7-05)

Application No. 10/824,654

Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that Raskar discloses no predetermined approximate expression. Applicant's arguments are incorrect, as written applicant's claim 1 claims a projector comprising means for projecting an image from a projector in accordance with a shape of the projection surface of a screen, the claim language does not eliminate the possibility that a means for generating a predetermined approximate expression is found elsewhere in the projector. Raskar does teach a projector which projects an image that has been modified to conform to the shape of a projection surface by utilizing a mathematical transformation in the projector sub-system. It is irrelevant that said predetermined approximate expression was generated in another sub-system of Raskar. Only that the projector sub-system receives a predetermined approximate expression generated elsewhere, that partially used a variable generated elsewhere to produce said predetermine approximate expression which will be used to project the distorted image. Further applicant's characterization of the least square fit is not accurate; it is a mathematical method/formula (a predetermined approximate expression) that when variable (observed values) are inputted into according to the rules of mathematics and the methodology of performing a least square fit, outputs a formula(s) approximating the observed data with an approximate polynomial expression. See the attached reference: "Least Squares Fitting". With regards to applicant's arguments that Raskar does not teach storing place of said predetermined approximate expression, at least the memory would be able to, and inherently some memory somewhere in the projector would be require to store the formula and method for performing a least square fit as is described in the attached reference. Accordingly applicant's arguments are not found persuasive.
